CANDIDATE'S DECLARATION

I hereby declare that the work presented in this dissertation titled “**CONFERENCE ROOM MANAGEMENT SYSTEM**”, in partial fulfillment of the requirements for the award of the degree of **Master of Technology in Information Technology**, submitted in **IIT, Roorkee – ER&DCI Campus, Noida**, is an authentic record of my own work carried out during the period from August 2002 to February, 2003 under the guidance of **Mr. V.N.Shukla**, Director (Special Applications), ER&DCI, Noida.

The matter embodied in this dissertation has not been submitted by me for award of any other degree or diploma.

Date: 26/02/03

Place: Noida

(Ritu Raj Arya)

CERTIFICATE

This is to certify that the above statement made by the candidate is correct to the best of my knowledge and belief.

Date: 26/02/03

Place: Noida

(V.N.Shukla)
Director (SA),
ER&DCI, Noida

ACKNOWLEDGEMENT

The work presented in this report would not have been completed without the guidance and support of many people. In first place, I would like to thank my guide, **Mr. Venkat Raman**, Engineer, BHEL – EDN, Bangalore, for his constant support, incredible enthusiasm and encouragement. I am grateful to **Mr. V. N. Shukla**, Director (SA), ER&DCI for his support and guidance. My sincere thanks are due to **Dr. P.R. Gupta** for the encouragement and valuable suggestions she provided me with during the course of my work. I am also grateful to **Mr. Munish Kumar** for the cooperation extended by him in the successful completion of this report.

Most of all I would like to thank my family. My parents provided me a perfect environment for my studies and supported me throughout. Finally, I would like to extend my gratitude to all those persons who directly or indirectly helped me in the process and contributed towards this work.

(Ritu Raj Arya)

1. Prof. Prem Vratt, Director, IIT Roorkee and Sh. R.K.Verma, Executive Director, ER&DCI, Noida.
2. Prof. A.K.Awasthi, Dean PGS&R, IIT Roorkee.
3. Prof. R.P.Agrawal, Course Coordinator, M.Tech.(IT), IIT Roorkee and Mr. V.N.Shukla, Course Coordinator, M.Tech.(IT), ER&DCI, Noida

ABSTRACT

The project deals with the reservation/booking of the conference rooms maintained by the organization, which were carried out manually with the complex book-keeping and maintaining a staff for this purpose. It is a system managing this job, thus eliminating the staff and complexity. The software does the booking and rescheduling from the terminals provided to the executives and the data are stored in the a database which is located at the server room. The rescheduling which was very difficult and time consuming process earlier is now made easy. The resource requirement is fulfilled easily as each data report can be generated easily at the time of ordering to outside vendor, earlier if a paper was misplaced then it was difficult to fulfill the requirement. The optimization of the rooms is done by the system as the minimum difference between the people and seats is made.

INTRODUCTION

1.1 Objective

To build a system which can efficiently and effectively maintain the conference rooms of the company utilized by the employees of the organization. To make it an easy to use GUI application, it should make reservations, cancellations and modifications from any terminal in the company and should make it easy to do, it should generate reports for various information, should optimize room allocation and eliminate the Front-Office, book keeping and paper work. It should be cost effective.

1.2 Scope

To build a system which can lead to quick scheduling and retrieving of information and update & modification should be easy to make. It should make work easy.

1.3 Organization

The Electronics Division (EDN) of BHEL was formed in 1976 mainly to establish a strong base in the areas of power and control electronics, to supplement and support BHEL's strong and unique presence in power generation and transmission equipment manufacturing. The division came into being when BHEL took over the Radio and Electricals Manufacturing Company (REMCO), which formally merged with BHEL-EDN in 1980. Growing from a meager turnover of Rs.3 crore in 1976-77 to 500 crore in 2000-01, BHEL-EDN has entered a new phase of growth. Its quick progress was aided by collaborations with international leaders in the field. But it was BHEL-EDN's pioneering spirit and the unwavering commitment to in-house solutions that has really contributed to its rapid growth and success. BHEL-EDN today holds on its own against the world's leaders in the field and has won many prestigious contracts against stiff competition from them.

In recognition of its commitment to the quality systems and procedures, the unit was awarded ISO-9001 certification by BVQI (UK) in July 1993. This was further re-certified in July 1996 for the updated version of ISO-9001. Presently the unit is treading along the path of Total Quality Management (TQM) as well as Business Process Re-Engineering (BPR). EDN has also become the first electronics industry in Bangalore to get ISO-14001 environmental management certification and also OHSAS-18001.

In addition to its comprehensive product profile, a number of new technology areas have been earmarked for future developments. Prominent among them are Power and Control Electronics for Traction Applications, Energy Management Systems, Training Simulators for Defence Applications, Large Telecommunication Exchanges, Electronic Energy Meters, etc.

In the new millennium, BHEL's vision envisages further growth for EDN, transforming it into a world class enterprise providing comprehensive solutions to customers, while exploring new frontiers in software and hardware applications to fulfill the growing needs and expectations of the global market.

1.4 Organization Chart

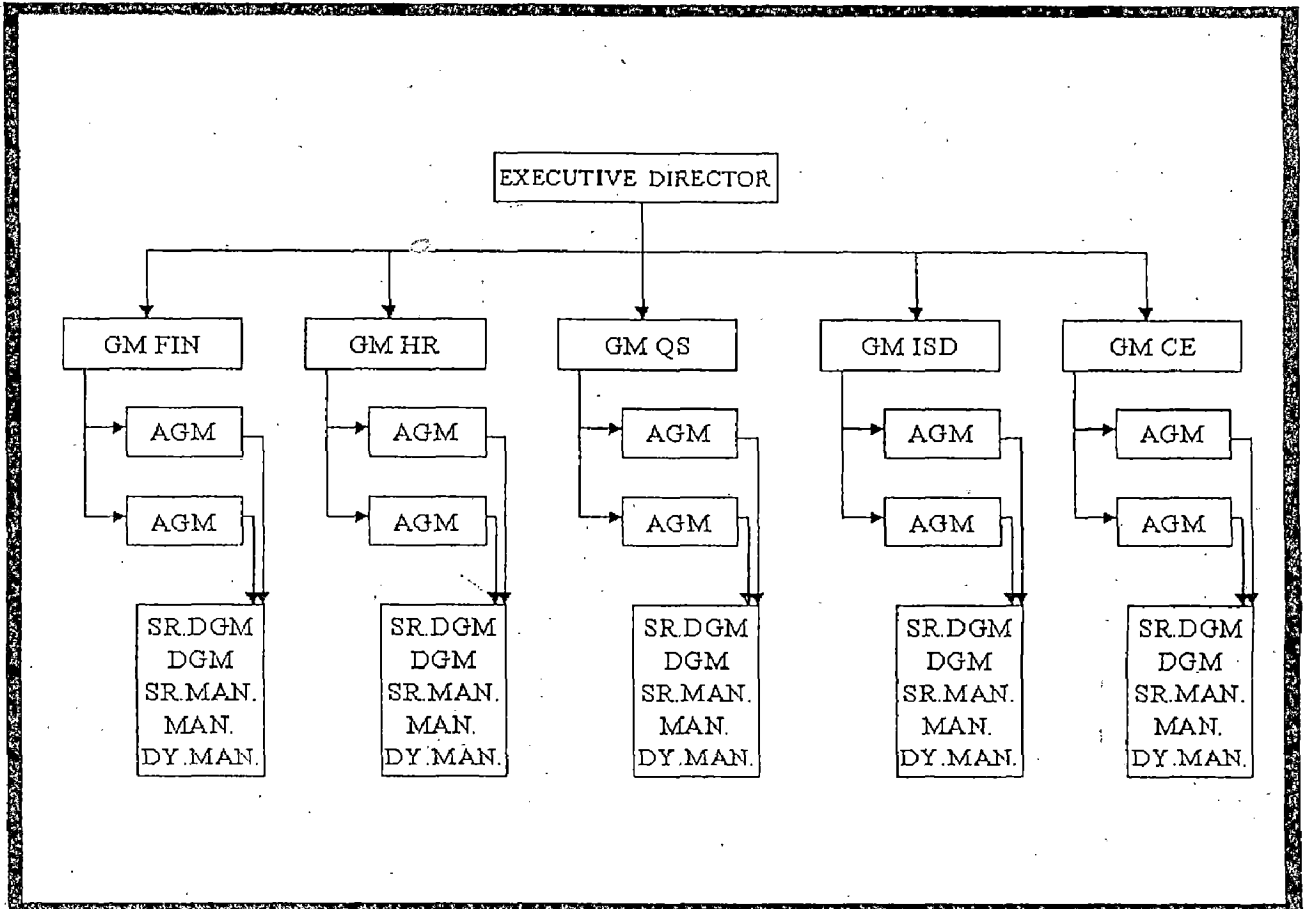

fig. 1.4.1

1.5 Organization of Dissertation

The project started at BHEL-EDN. The first thing done there was to get the structure of the organization, this took some days to get the information about the organization and start the project keeping in mind the users and the requirement to fulfill.

Then the study over the project began with the involvement of the employees dealing the management of the conference rooms at the EDN. The required information about how they work there and how the reservations are done were and how the book-keeping was done was studied.

The report begins with the objective that was sought out after understanding the project and making the initial studies. Then the scope for the project was drawn from the objective and the work to be done. Then begins the study of the database to be used and the front end in which the project is to be implemented. EDN is using SQL Server 7.0 for maintaining its databases and the Visual Basic 6 is used there for the front end and in-house software development. Then the studies regarding SQL Server 7.0 and Visual Basic 6 were done. The books used are given in the references section.

Then began the real work of the project, the requirements study, which was started at the beginning and was going on in the mean time at the time of study about the back-end and front-end. it is explained in chapter 3. Then the system configuration requirement study was done, which is given in chapter 4. After the requirements study was over, the work on the system started and the database was designed and normalized. The keys were assigned and implemented. The software was started to design keeping the database connectivity and manipulation in mind. It took long time to develop the design and logic and the software was ready for the testing. This all is given in chapter 5. the system was then tested on the test data and then on real-time data, this is shown in chapter 6. After testing the system the results were recorded and the software was implemented, this all is given in chapter 7. the conclusion is made in chapter 8 and references are provided in chapter 9.

LITERATURE SURVEY

The project that has been worked on, deals with a real life problem of an organization. Therefore, there was not to go much in the details of the theoretical studies, rather it has to be studied in the working environment and solution has to be designed. So the major work was studied in real time and then at the time of implementation the help from the texts were taken. The books referenced are given in the references section. Some of the terms has been described below.

Some of the terms that are to be known are,

DATABASE¹: A database is a collection of related data. It is the definition of a database in the simplest form. By data, we mean known facts that can be recorded and that have implicit meaning.

DBMS²: Database Management System is a collection of programs that enables users to create and maintain a database.

DATA MODEL²: A data model is a collection of concepts that can be used to describe the structure of a database.

DATABASE SCHEMA²: The description of a database is called a database schema. And the diagram that is drawn is called schema diagram.

The database is classified in three major categories

- **RELATIONAL MODEL²:** It is represented in tabular form.
- **OBJECT MODEL²:** It is represented on OOP concepts.
- **NETWORK MODEL²:** It is represented in tree form.

NORMALIZATION¹: It is a process of analyzing the given relation schemas based on their functional dependencies and primary keys to achieve the desirable properties of minimizing redundancies and minimizing the manipulations of the database.

PRIMARY KEY²: It is an ordered file whose records are of fixed length with two fields. The first field is of the same data type as the ordering key field, called the primary key.

SECONDARY KEY²: It is an ordered file with two fields. The first field is of the same data type as some non-ordering field of the data file that is primary key. The second field is either a block pointer or a record pointer, called secondary key.

The project deals with the Relational Database Model,

DOMAIN²: A domain is a set of atomic values. By atomic we mean that each value in the domain is indivisible .

ATTRIBUTES²: An attribute is a set of all the data types that are of same type and are represented in one row.

TUPLE¹: A tuple is a set of data corresponding to one row. They are of different types but correspond to one entity.

RELATION¹: A relation is a relationship that join two attributes to a single entity.

In this project we are using SQL Server 7.0 as the database which is a Relational Database. The tables are designed and are manipulated through Query Analyser.

The front-end designing software is Visual Basic 6. The studies were carried out and the forms were designed. It involves two steps,

- The visual programming step³
- The code programming step³

In visual programming step, the forms are designed by using the tools that come with the Visual Basic package. The code writing for the visual environment is done in the package and we have to just draw the objects and the code is put from back which is invisible. The formatting of the objects is done through the properties window in the visual environment and the desired looks are provided to the objects.

In code programming step, the in-built text editor is used to do the real programming stuff, the logics are made and formed in code and implemented in the objects on the form through the use of functions. This is the place where all the logics are implemented.

The visual environment makes it easier to concentrate on the programming part than designing part. It is a very user friendly package providing ease of aking the software.

REQUIREMENTS ANALYSIS

3.1 Existing System

The company manages the reservations and logistics of its various conference rooms by a Front-Office, operated manually. Employees submit their requests for the reservation, modification and cancellation of rooms and resources on the prescribed forms after getting the necessary approval from the concerned authorities.

The front-office staff keeps track of conference rooms' booking and availability status, ensures readiness of rooms and make arrangement for the equipment and refreshment required.

The staff also ensures that the rooms are optimally used – a room with a larger capacity is not allocated to a smaller requirement. To achieve this, they manually keep track of the bookings and swap the room numbers whenever possible. In case no suitable room is available for a particular booking request, the Front-Office also maintains a queue. It manually monitors it after each booking cancellation and allocates the now available room to a suitable request in the queue.

The Front-Office maintains various reports for efficient management – details of a room's booking, equipment/refreshment required on a particular day etc.

3.1.1 Problem with Existing System

- Employees have to depend on front office for booking.
- Modification of slots and cancellation of booking is difficult.
- Equipment sources from external vendors cannot be made available in time due to non-availability of proper reports.
- Loss of information can occur if papers carrying booking information are misplaced.
- Room availability status is difficult to maintain manually.
- In the event of any modification/rescheduling of a booking, it is difficult to properly implement the changes, especially when the time available is very less.

-
- Ensuring the optimum use of the rooms is difficult to achieve manually.
 - Lots of paper work is involved in keeping records and maintaining reports.
 - There is a lot of to-and-fro movement of papers among various staffers – e.g. User chases the HOD for authorization, Administrator has to frequently correspond with Back-Office for confirmation of hired resources availability.
 - Lots of time gets wasted in such back-forth communication.
 - Last minute changes are difficult to communicate.

3.4 System Description

Conference Room Management System is the software that helps in the efficient management of conference rooms at the company's office. Company has several conference rooms that can be utilized for meetings and conferences. Employees can book rooms in the slots of ½ hour. It has graphical user interface and is user friendly.

3.4.1 Features of CRMS

- From any location employees can access the application.
- Only authenticated users can access the application.
- Once the user booked the room, there is reminder mail back to the user at least two days before.
- Tracking of status of hiring equipment and refreshment.
- Automatic generation of reports for efficient communication of information to services department.
- Master data are already with the HR department be directly put into system without requiring user to reenter all the data over and again.
- Rooms can be booked in the slots of half-an-hour only, between 9am to 9pm.
- Booking can be done for the next fifteen days only.
- Only the HOD of the User's department can authorize Hired Equipment booked by him.

3.4.2 Conference Room Management System

CRMS: The Conference Room Management System is a system primarily meant for the efficient management of the conference rooms of an organization.

For calling a meeting or a conference the User (the End User) has to make a booking of a Conference Room in advance, along with the requirements of the equipment which may either be available within the organization (the Regular Equipment) or are required to be hired from outside (the Hired Equipment) and the Refreshments.

Among all the users, which interact with the system, their roles can be identified among one of the following:

1. **End User:** This is the user which makes use of the services of CRMS for booking, cancellation, modification of booking etc.

RoleID:"U"

2. **Administrator:** This user is responsible for the management of the CRMS by

- o Identifying the valid users of the system -by supplying User's data.
- o Providing the list of available Conference Rooms.
- o Providing the list of equipment and refreshment available for booking.

RoleID:"A"

3. **Back Office:** This user provides the services to the End User by

- o Making the booked items available during the booking
- o Interacting with the Vendors for arranging Hired Equipment and Refreshment

RoleID:"B"

4. **HOD (Head of Department):** They have to interact with the system to confirm the authorization-status of the Hired Items required by the respective End Users of their Department.

RoleID:"H"

The CRMS provides a GUI for each of the categories of the users identified above.

For End User, it provides the facilities of Room Booking (in the slots of Half an hour) , Cancellation or Modification of a booking. It also gives the reports relating to the availability of a Conference Room on particular day or time-slot or status of all rooms during a slot etc.

For Administrator, it provides the GUI to add/delete/update User's Data , Conference Room's Data , Equipment or Refreshment Data.

For Back Office, it gives the reports relating to the Orders and a GUI to change the Confirmation status of any Equipment or Refreshment-as per the availability.

For HOD, it provides the screen to change the Authorization Status of Hired Items of a particular booking by entering the BookingID .

User

New Booking

Click on the Booking Menu Item. The New Booking Form will appear on the Screen. There we can choose the Date of the Booking. A New Booking can be done for a Period of NEXT 15 DAYS only. The time slot for the conference room booking can be chosen from the Time Period from the "From Time" and "To Time" combo-boxes. The Booking can be done between 9 a.m. to 9 p.m. (the working hours in a day). The Booking can be done in the slots, which are multiples of half-an-hour. A Booking can span over more than one slot. Time slots are Optional, i.e. if you want to do booking after viewing the suitable empty slot, just keep time slot fields empty. You have to enter the Minimum Seating-Capacity of the room Required by you. On clicking the Next Button to check the Room No and Time Slot allotted to you on the Next Form. In case you don't get the Room-Booking on the Required slot, modification options will come.

Modify your booking's time slot after viewing the room-availability details from the room-data displaying grid. Enter into waiting list. You can keep the time slot same. You may get the booking, if any room with appropriate seating capacity will get it's booking cancelled on the slots corresponding to your booking. If you get booking, click on the Next Button, to get the Equipment and Refreshment booked for your booking. Now, you will reach on the Book Regular Equipment form. On Book Regular Equipment form, the user's shown the list of Equipments, which

are available within the organization, i.e. the regular equipment. User has to choose equipment from the list shown on right hand side. He has to select the equipment from the list and to include it into the Booking, he has to click on the Next Button. The default value of quantity will be "One". If user wants to modify the quantity, he can change it through the text-box given below the lists, by entering the required quantity in the box and then clicking on the Change Button. Now the user can book the Hired Equipment by clicking on the Next Button. He will get a list similar to the Regular Equipment's list. The booking process is similar to that of the Regular Equipment's Booking. The difference being that there's no list of available quantity. Now, the user can opt for the booking of Refreshment, by clicking on the Next Button. The process is similar to that of booking of Hired Equipment. The User can now make his booking final by clicking on the Book Now Button. This will show him a message box, containing the brief booking information, and a BookingID. This number (similar to PNR in railways) will be used in future as reference to that booking for any Rescheduling and/or Modification and HOD's authorizations .

For getting the Hired Item(i.e. The Hired Equipment and Refreshments), the user has to take the HOD's Authorization, from the HOD of his own department. Although the HOD can see all the BookingID's of the employees of his own department (on opening the HOD's Authorization form), it is strongly recommended to inform the HOD about the Booking by specifying him the BookingID for getting the Authorization, because all the bookings, with any of the items with Authorization as "No" will be deleted, after One day, of day, on which the booking was made.

Reschedule/Modify a Booking

Modify/Reschedule Booking's when clicked on the menu opens the rescheduling form. To reschedule the booking you have to select the bookingID provided on your booking made earlier, by selecting it, it will fill the form from the database to be modified. From here you can modify/reschedule the booking or make new arrangements for the Regular Equipments and/or Hired Equipments and/or Refreshments.

Inquire about a Booking

It is the same form that appears for the modification/rescheduling but the features are now disabled for any changes to be made and the information about the booking regarding room number, seating capacity, refreshments, etc.

Cancel a Booking

On clicking the cancellation menu the relevant form appears and by selecting the bookingID the reservation for the conference room can be cancelled. There are two options available for the cancellation purpose one is the cancellation for the confirmed booking and other one is for the waiting list booking. On canceling the slot is made empty or occupied by the next booking in the queue.

Change Password

On clicking this menu option the form for changing the password appears, this is for changing the password of the all the users. When a new user is created by the Administrator the employee number obtained by the user becomes its default password, which it can change by using this form. And for the security purpose it can be used frequently.

Administrator

Update the User's Database

Add a New User

Clicking the Add New in the Administrator's menu Add Users form will be opened, with the option Add as selected. Enter the required information in the corresponding fields. EmployeeID, This field should be a Number. Employee Name, maximum size of this field is 20 characters. Department, maximum size of this field is 4 character. RoleID, this can be chosen from a combo-box, from either of the 4 choices-A/U/B/H. Now click on the Add New Button, to enter the user in the database.

Modify an Existing User

To modify an already existing user click on the modify user menu and the relevant form will be opened where the modifications can be made. The process of modifying an employee is similar to that of "Add New". Difference being that now the Administrator has to choose the EmployeeID from a combo-box. All the information will be displayed in the corresponding fields. The Administrator can edit any field as required

and then by clicking on the Modify Button, the information of the employee will be modified and saved in the database.

Update the Rooms Database

You can add a new room or modify an already existing room by clicking the update rooms menu. There are two options for this menu one for adding new room and the other one is for modifying the existing room. On clicking the required one the database can be updated.

Update the Resources

You can add new resources or modify already existing resources by clicking the update resources menu. There are three options for this menu one for adding the Regular Equipments which again has two options one for adding and another for modifying, second one is for the Hired Equipments and the third one is for the Refreshments. On clicking the required one the database can be updated.

Update Regular Equipment: From here you can add/delete/reserve/modify for the Regular Equipments.

Update the Hired Equipment: From here you can add/delete/reserve for the Hired Equipments.

Update the Refreshment: From here you can add/delete/reserve for the Refreshments.

Back-Office

Back-Office Confirmation

Clicking on Back-Office's Confirmation Process menu item. It'll open the Back-Office Confirmation Form. The Back-Office will see the two lists on the screen, one corresponding to the Refreshments and other for the Hired Equipment. The list will be displaying BookingID, Item Code, Item Description, Booking Date, Room No. of the Booking, Start Time and End Time of the Booking, the Quantity required of the Item and the Confirmation status of the item-this is the only field which the Back-Office User can change. If there're no requirement of the hired items (Equipments and the Refreshments) for next two days, it'll be informed to the user through the message boxes on the opening of the form. It's also possible that the bookings are made, but these are not authorized by the HOD of the User's department.

The Back-Office can change the Confirmation Status: Yes/No (i.e. whether the required item will be available during the time of the meeting or not) by, First selecting and then double clicking on the data-grid display or through the combo-box, by clicking on the required confirmation status-value.

HOD

Authorization Process

For any booking involving Hired Items, i.e. the Hired Equipment and the Refreshments, the user is required to take the department's permission. This is to be done by the HOD of the user's own HOD, who will give the Authorization by changing the authorization status field of the Booking's Items. The Authorization Status can be Yes, The permission to book that items is granted. Not-Required, The permission to book that item is not granted. The item is not thought to be mandatory for the booking. No, The permission not given-for that particular item as well as for the booking. The booking will be cancelled, even if one item of the booking has Authorization status as "No". The booking will be cancelled after one day of the day, on which the booking was made, if the Authorization status remains as "No" for any item of that booking.

The Authorization Status for a booking can be changed as by clicking on the Authorization Process menu. This will open the HOD Authorization form. For the Authorization Process the HOD has to specify the particular BookinID. The HOD gets a choice on the screen of the BookingIDs in a combo-box. These BookingIDs are of the bookings made by the employee of the HOD's own department. Choose a BookingID from the list. All the details of the hired items of that booking will come in a data-grid display, which contains Code of the item required (RESOURCECODE), Description of the item HIRED EQUIPMENT/REFRESHMENT (RESOURCEDESC), the description of the equipment required (DESCRIPTION), quantity required (QUANTITY) and the present authorization status (AUTHORIZED). The Authorization status can be changed through selecting an item from the data-grid display. Double click on the data-grid, select the required status-value from the combo-box to change the authorization status to required value, of a single item. Select a particular status value from the combo-box, click the Change All Button, to change the authorization status of all the displayed items of the booking. The HOD can also change the required Quantity of the items, by editing the quantity field to any value. The HOD can only decrease the

Quantity-value. He can't increase the Quantity. If he does so, he will get an error message stating the "Required Quantity Value".

Miscellaneous

The other things are the various reports generated by the system regarding the information about the room booking, status of available rooms, history of the room etc.

SYSTEM CONFIGURATION REQUIREMENT

Following is the minimum requirement of the system required to run the CRMS:

4.1 Hardware Configuration

Minimum requirement

Processor: 260 MHZ.

RAM: 32 MB.

HDD Space: 2 MB.

4.2 Software Configuration

Operating System: MS-Windows-NT 4.00

Back End: MS-SQL 7.0

Others: Internet Explorer 5.0

TEST DATA	: None.
EXPECTED RESULT	: The SPLASH FORM containing the information of CRMS should appear on the screen.
ACTUAL RESULT	: SPLASH FORM appeared.
TEST	: LOGIN FORM should appear after SPLASH FORM.
USER ACTION	: None.
TEST DATA	: None.
EXPECTED RESULT	: The LOGIN FORM should appear after 10 seconds of the appearance of the SPLASH FORM.
ACTUAL RESULT	: LOGIN FORM appeared.
TEST	: User login.
USER ACTION	: User enters his login id and password.
TEST DATA	: Employee's login id is invalid.
EXPECTED RESULT	: A message box, stating that only numerals

	should be entered or prompting for the entry of a valid login id should appear.
ACTUAL RESULT	: Message box appeared.
TEST DATA	: Employee's password is invalid.
EXPECTED RESULT	: A message label, stating invalid password should appear. Password textbox should get clear and focus.
ACTUAL RESULT	: Message label appeared. Textbox gets clear and gets focus.
TEST DATA	: Employee's login id and password are valid.
EXPECTED RESULT	: The MENU FORM containing menu items should appear. Main menu items should be enabled/disabled as per user's ROLEID. Database table should be updated.
ACTUAL RESULT	: MENU FORM appeared. Items are enabled/disabled as per the ROLEID. Database table is updated.
TEST	: NEW BOOKING
USER ACTION	: User enters the date and seating capacity and time slot for the booking in the text boxes and combo boxes. Then the user presses the NEXT button.
TEST DATA	: Entered date in mm/dd/yy format and within 15 days from booking date, time slot with from time less than end time and seating capacity.
EXPECTED RESULT	: User gets output according to data entered. If he has entered time slot then, if available he gets room no. allotted to him. ROOMBOOKING table gets updated, a new

tuple with new booking id gets inserted into the table else for the same date rooms with their description and seating capacity more than that specified should appear. In this case user has other options also.

ACTUAL RESULT : Room allotted to the user with start time and end time as specified and ROOMBOOKING table updated.

USER ACTION : User enters date in the text box provided.

TEST DATA : Date is not entered as per restrictions.

EXPECTED RESULT : Message box appears with you have entered past date or invalid date format.

ACTUAL RESULT : Message box appears.

TEST : ROOM SELECTION

USER ACTION : User enters time slot and one of the rooms available is shown to him on screen. User is allotted the same room for his booking. User presses NEXT button.

TEST DATA : Time slot and room no. entered as per instructions.

EXPECTED RESULT : A message box appears showing him his booking id asking him to click YES/NO/CANCEL. If he selects YES then a new booking id in ROOMBOOKING table is generated and other details entered by the user are inserted into the table.

ACTUAL RESULT : Message box appeared and table updated.

USER ACTION : User leaves one or more of the fields unselected.

TEST DATA : Leaves start time and room no. unselected.

EXPECTED RESULT : Please fill all the fields message is displayed to the user.

ACTUAL RESULT : Message box appeared.

USER ACTION : No room is suitable for the user from the list of available rooms and time slots. User chooses to be in waiting list or to book for some other date or chooses no booking required.

TEST DATA : None.

EXPECTED RESULT : Waiting list no. is displayed to the user or room booking screen is displayed to the user or menu for appears.

ACTUAL RESULT : As expected.

RESULTS AND DISCUSSIONS

The software is made and implemented at the EDN and tested for the realtime data. The software was working to the expected results and as at the time of testing. The software is now in use at the EDN and is working as per the results. The total process was time consuming, while understanding the requirements, but when it was understood then the process of working was in the clear direction. Then the work began with the toiling with the books to build the system. Then the problem came at the time of making logic for complex problems, but they were solved with the help of the guide at the EDN. Overall it was a great experience to work on the real project and at the implementation place. It made it easy to understand the need of the users and make the software.

CONCLUSION

The project title “Conference Room Management System” for the third semester has been created successfully in BHEL using Visual Basic 6 and SQL Server 7.0. The software has been tested and implemented and working successfully. The coding is around 6500 LOC in Visual Basic.
